

Greyin — Idea-Explainer Video Script

BITSom Vertex Builders' Pitch Fest 2026 · Founder video submission · Anand Rajendran

Format

- **Length:** 2:15–2:45. Front-load the problem — no "Hi, my name is..." intro.
- **Shot:** to camera, eye-level, window light in front of you, mic close (wired earbuds fine). One clean background.
- **Editing:** record each of the four sections separately and stitch — don't chase one perfect take. Optional: 3–5s screen capture of the live platform over the "already built and live" line.
- This is the **founder / idea video**, separate from the product demo (still to be recorded).

Main script (~2:30)

1 — What you're building (~0:40)

Every year, millions of experienced professionals — people with 12, 20, 30 years behind them — get filtered out of hiring by keyword-matching software, or made redundant in a restructuring. Not because they stopped being good at the work. Because nothing proves the work at scale.

I'm Anand Rajendran, and I'm building **Greyin — an AI-native trust and verification layer for hiring experienced talent.**

It's one platform with six connected features and a single verified identity. Every real interaction on it — a delivered project, a genuine review, a completed engagement — becomes part of a portable, audited trust score that employers can actually search against. Three of those features are how we earn revenue, billed straight to the corporate employer. The rest exist to keep the score honest.

on-screen: "Greyin — the trust & verification layer for hiring experienced talent" / quick pan of the 6 live apps

2 — What inspired you (~0:35)

This came from hitting the wall myself. I spent thirteen years in automotive embedded systems, most of it in verification and validation — the discipline of proving that safety-critical software does exactly what its spec claims. Then I pivoted into full-stack and AI, and re-entered the job market as a senior candidate.

A decade of real work, and a resume upload was the only proof anyone would look at. Meanwhile,

every product I built along the way had the same flaw — "verified" meant nothing; it was a self-reported checkbox. So I started building the layer that would actually check.

3 — Long-term vision (~0:40)

The long-term vision is that a **verified track record becomes portable infrastructure** — the way a credit score is, but earned from real work instead of debt, transparent instead of a black box, and owned by the person it describes.

If Greyin works: an employer anywhere can search for a genuinely verified expert and trust the result. A professional carries their proven reputation between platforms instead of rebuilding it every time. And anticipatory hiring — matching people to roles that don't exist publicly yet — becomes normal, because the trust signal underneath it is finally reliable.

The whole platform is already built and live — six features, six AI systems in production, a full security audit closed. What's left is turning that into a business.

on-screen: 3–5s screen capture of the live platform / a profile showing the Greyin Score breakdown

4 — Why this program (~0:25)

And that's exactly why BITSoM Vertex. The engineering is done; the gap is commercial. I need venture-building rigor, warm introductions to the HR and L&D buyers Greyin sells to, and the enterprise pilot pathways this program is built to provide. That's the piece I can't build alone — and it's the piece Vertex does best.

I'm Anand. This is Greyin. Thanks for watching.

60-second cutdown

Millions of experienced professionals get filtered out of hiring by keyword software, or cut in a restructuring — not for lack of skill, but because nothing proves the skill at scale.

I'm Anand Rajendran. I'm building **Greyin — an AI-native trust and verification layer for hiring experienced talent**. One platform, six connected features, one verified identity. Every real interaction becomes part of a portable, audited trust score that employers pay to search.

I hit this wall myself: thirteen years in automotive verification, then re-entering the job market with a resume upload as my only proof.

The vision is a verified track record as portable infrastructure — like a credit score, but earned from real work and owned by you. The platform is built and live; six AI systems in production, a security audit closed.

The gap now is commercial — enterprise pilots, HR and L&D introductions, venture-building rigor. That's why BITSoM Vertex.

Delivery checklist

- **First 8 seconds** are the whole video — open on the problem, not yourself.
- Say "13 years," "six features," "six AI systems," "built and live" as flat facts — no "kind of," "we're trying to."
- Look at the **lens**, not your own image.
- Pause a full beat between the four sections — clean cut points for the editor, room for the viewer to absorb.
- Re-record any section where you rush; keep the best of each.
- End on the deck's closing line so video and pitch reinforce each other: *"real work into portable, verified trust — sold to the employers who need it most."*

Figures match the pitch deck (v18): 6 core features + Greyin Hub identity layer · 3 revenue lines · 6 live AI systems · 38-finding security audit closed · platform live, pre-launch · Greyin Score = transparent Bayesian-shrinkage, interaction-gated.
